Feature: Homepage Search to Homes Results Routing & Refinement

Platform: Web Desktop / Mobile Web (airbnb.co.in)

Target Audience: Guests searching for Homes

1. Problem & Context

Guests begin their journey on the airbnb.co.in homepage using the unified search bar (Where, dates, guests). We need consistent routing from the homepage directly to the results page with all user inputs preserved. Additionally, guests require immediate access to filters and the map so they can refine their search and make quick decisions. This aligns with documented Airbnb search behavior and refinement workflows.

2. Core User Story

As a guest starting on the airbnb.co.in homepage,
I want to enter a destination, optional dates, and guests, and land on a results page that reflects those inputs,
so I can refine my search using filters and a map to find a place that fits my trip.

(Note: "Search results page" explicitly means the user typed a destination city in the 'Where' field on the homepage and clicked Search, regardless of whether dates were provided).

3. Goals & Non-Goals

Goals

- Route users successfully from the homepage search to the Homes results page with destination, dates, and guests preserved.
- Ensure the results page supports continuous refinement via Filters and Map controls.
- Keep the entered inputs visible and editable directly on the results page to prevent users from having to use the browser's "back" button to adjust their query.

Non-Goals

- Changes to the checkout flow or pricing logic.
- Modifications to the underlying search ranking or recommendation algorithms.
- Mobile application (iOS/Android) feature parity (this initiative is strictly Web).

4. Scope Definitions

In-Scope

- **Homepage Search Bar:** Displays fields for *Where*, *Check-in*, *Check-out*, and *Who*. Accepts typed destinations (city/region), optional dates, and guest counts.
- **Routing & Display:** On clicking Search, the Homes results page opens. Applied parameters must be visible in the results header.
- **Refinement Tools:** The results page exposes existing Filters and Map controls.
- **Flow 1: Complete Input:** Search with destination, valid check-in/checkout dates, and guests.
- **Flow 2: Partial Input:** Search with destination and guests only (no dates). Results load for the destination, allowing the user to add dates directly on the results page later.
- **Localization (i18n):** Maintain existing English (IN) labels visible on the homepage and results pages.

Out-of-Scope

- Introduction of new filter types or the reordering of existing filters.
- Routing or results configuration for Experiences/Services (handled in separate stories).
- Any structural or visual changes to the global header navigation.

5. Acceptance Criteria (QA Test Scenarios)

The following Behavior-Driven Development (BDD) scenarios will guide QA test case creation and sign-off.

Scenario	Given	When	Then
1. Route to results with dates	I am on the airbnb.co.in homepage. I type a destination city (e.g., Hanoi) into <i>Where</i> . I select valid Check-in/Check-out dates and Guests.	I click Search.	The search results page opens for Homes. The destination, dates, and guests are preserved and shown at the top of the results.
2. Route to results without dates	I am on the airbnb.co.in homepage. I type a destination (e.g., Goa) and add Guests but skip dates.	I click Search.	The search results page opens for that destination with Guests preserved. I can add dates on the results page without returning to the homepage.

Scenario	Given	When	Then
3. Filters available on results	I land on the search results page.	I open Filters.	I can refine using the standard Airbnb filters (as documented in Help). I see updated results upon applying filters.
4. Map available on results	I am on the search results page.	I open/use the Map view.	Listings display on the map for the current search. The map supports location-based refinement (as documented).
5. Inputs remain editable	I am on the search results page.	I click into the destination, dates, or guests controls in the header.	I can modify the parameters. I can refresh the results without navigating back to the homepage.

6. Accessibility (A11y) Requirements

- **Keyboard Navigation (Homepage):** The *Where*, *Check-in*, *Check-out*, *Who* fields, and the *Search* CTA must be focusable in a logical, sequential order using the Tab key.
- **Keyboard Navigation (Results Page):** The Filters and Map controls must be keyboard-accessible and clearly display a visible focus indicator state when navigated to.

7. UX & Copy Guidelines

- **Input Field Labels:** *Where*, *Check-in*, *Check-out*, *Who*
- **Call to Action (CTA):** *Search*
- **Language:** English-IN (en-IN) standard localization for all above labels.
